### **Denver Company Utilizes Breakthrough Technology For Envelope Sealing**

Denver Air Barrier offers an innovative and award winning envelope sealing technology for commercial and residential buildings.

**DENVER, CO:** January 2020 – Denver Air Barrier promises to transform the way home and commercial buildings are constructed with a breakthrough envelope sealing technology. The new technology, called AeroBarrier™, offers a first-of-its-kind approach to effectively sealing the entire building envelope using an aerosolized sealing system. The [process](#) simultaneously measures and seals building envelope leaks in residential and commercial buildings. A computerized process provides a faster, less expensive way to seal the building envelope and quickly meet even the most stringent building specifications for envelope tightness. At the completion of the sealing process, the system automatically produces a final certifiable document, guaranteeing results.

AeroBarrier seals holes as large as ½", and as tiny as a human hair. Aerosol sealing is extremely effective at sealing narrow gaps and extremely small holes that are typically not cost-effective or are missed during manual sealing. The entire AeroBarrier™ process, from setup to completion, takes approximately 4-hours for a typical single-family home. The area needs to be aired out for 30 minutes after the sealing is complete. This is done by opening doors and windows while running the fan. But work can resume in the space as soon as the sealing equipment is removed and 30 min has passed. AeroBarrier™ may be applied at any time between rough-in construction or while completely occupied, although the ideal times are right before insulation or after sheetrock. In a home with finished floors, countertops, furniture, elements are covered or masked to keep things clean. The AeroBarrier™ sealant does not stick to vertical surfaces like windows or walls. Prices range from \$.95 - \$1.50/square foot. Aero Guaranteed proven results saves money in construction, utility costs, labor and materials. Each application can vary based on size and style.

AeroBarrier™ has been selected to receive a 2019 Product Innovation of the Year Award by Green Builder magazine. Chosen among dozens of competing products and technologies, AeroBarrier™ stood out as a major achievement in energy efficient building science and a catalyst for advancing the development of energy efficient homes and buildings. National home improvement television shows such as [This Old House](#) and [Holmes and Holmes](#) have featured AeroBarrier in their programming.
